## (Southern Universities Physics Research Agreement)

### Coordinators of the courses:

- **Vincenzo Canale** vincenzo.canale@na.infn.it (U. of NAPLES)
- **Francesca Crispo** francesca.crispo@unicampania.it (UniCampania, CASERTA)
- **Claudio Corianò** claudio.coriano@le.infn.it claudio.coriano@unisalento.it (UNISALENTO)
- **Giuseppe Gonnella** giuseppe.gonnella@ba.infn.it (U. of BARI)

## Emails of the Faculty members coordinating for subjects I- to I X

- 1) Margherita Primavera <[margherita.primavera@le.infn.it](mailto:margherita.primavera@le.infn.it)>
- 2) Marcello Abbrescia [marcello.abbrescia@uniba.it](mailto:marcello.abbrescia@uniba.it)
- 3) Maurizio Paolillo <[maurizio.paolillo@unina.it](mailto:maurizio.paolillo@unina.it)>
- 4) Fulvia De Fazio <[fulvia.defazio@ba.infn.it](mailto:fulvia.defazio@ba.infn.it)>
- 5) Giovanni Acampora [giovanni.acampora@unina.it](mailto:giovanni.acampora@unina.it)
- 6) Saverio Pascazio <[saverio.pascazio@ba.infn.it](mailto:saverio.pascazio@ba.infn.it)>
- 7) Elisabetta Bissaldi [elisabetta.bissaldi@poliba.it](mailto:elisabetta.bissaldi@poliba.it)
- 8) Giuseppe Gonnella [giuseppe.gonnella@ba.infn.it](mailto:giuseppe.gonnella@ba.infn.it)
- 9) Maria Lepore [maria.lepore@unicampania.it](mailto:maria.lepore@unicampania.it)
- 10) Luca Girlanda [girlanda@le.infn.it](mailto:girlanda@le.infn.it)

## *I. Particle Detectors–Trigger/DAQ*

<b>Module 1</b>	<b>Particle Detectors</b>
<b>Lecturer</b>	Margherita Primavera (INFN Lecce)
<b>Planned hours</b>	22
<b>Planned schedule</b>	
<b>Prerequisites</b>	Charged particles interactions with matter
<b>Description</b>	Generalities on gaseous detectors. Ionization and transport phenomena in gases. Amplification in gases. Gaseous detectors: ionization chambers, proportional counters, MultiWire Proportional Chambers, Drift chambers, TPC, Geiger counters, streamer tubes, Resistive Plate Counters. Calorimetry. Electromagnetic and hadronic calorimeters. Calorimeter calibration and monitoring. Cherenkov detectors: DISC, RICH, DIRC. Transition radiation detectors. Micropattern detectors, dual readout calorimeters.

<b>Module 2</b>	<b>Photodetection</b>
<b>Lecturer</b>	Elisabetta Bissaldi (Politecnico di Bari)
<b>Planned hours</b>	16
<b>Planned schedule</b>	1 lecture per week two hours each
<b>Prerequisites</b>	Experimental particle physics background
<b>Description</b>	This course aims to provide the student with advanced knowledge of radiation measurements and detection techniques, from classic scintillation detectors to Silicon Photomultiplier devices. It requires an elementary background in radiation measurements, radiation matter interactions and basic electronics. The program includes Photon-matter interactions; Organic and Inorganic scintillators; Optical coupling; Solid-state photodetectors; SiPM technologies, properties and Applications. Part of the course will be devoted to laboratory sessions.

<b>Module 3</b>	<b>Trigger and DAQ for Particle Physics</b>
<b>Lecturer</b>	Massimo Della Pietra (Univ. Federico II NAPOLI)
<b>Planned hours</b>	10
<b>Planned schedule</b>	
<b>Prerequisites</b>	Experimental particle physics background
<b>Description</b>	Introduction to trigger and data acquisition system for experimental physics. Basic elements and definitions: trigger latency and trigger rate. Connection between trigger e data acquisition: dead time and busy status. Multilevel trigger systems, trigger for High Energy Physics at colliders. Integration of Trigger - DAQ and related systems Event building, Run Control, Online data quality. Description of most relevant trigger system for collider HEP: the trigger system of the LHC experiments. Trigger systems for fixed target experiments and for test-beam setup. Triggerless DAQ systems for particle and astroparticle physics. The impact of the trigger system efficiency on a physical measurement.

<b>Module 4</b>	<b>Detection methods for nuclear astrophysics and applications</b>
<b>Lecturer</b>	R. Buompane (Università della Campania «Luigi Vanvitelli»)
<b>Planned hours</b>	20
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic notion of detectors and nuclear reactions.
<b>Description</b>	<p>The course aims to introduce the detection methods used in nuclear astrophysics and in the applied nuclear physics. Modern techniques developed for nuclear astrophysics and their use in applied physics, as the characterization of targets and/or materials, will be presented.</p> <p>Low energy accelerators. Recoils Mass separators. Underground measurements. Accelerator Mass Spectrometry (AMS). Time of Flight (ToF). Micro Channel Plate (MCP). Position sensitive detectors. Setup and detection for the Ion Beam Analysis (IBA) characterization of targets/materials.</p>

## *II. Signals Formation and Treatment in Particle Detectors*

<b>Module 1</b>	<b>Signals Formation</b>
<b>Lecturer</b>	Marcello Abbrescia (uniba)
<b>Planned hours</b>	10
<b>Planned schedule</b>	5 lectures of 2 hours each
<b>Prerequisites</b>	Basic notions of electromagnetism and of particle detector physics
<b>Description</b>	<ul style="list-style-type: none"> <li>- Electrostatics-Principles-Reciprocity-Induced currents-Induced voltages-Ramo-Shockley theorem-Mean value theorem- Capacitance matrix-Equivalent circuits;</li> <li>- Signals in: -Ionization chambers-Liquid argon calorimeters-Diamond detectors-Silicon detectors-GEMs (Gas Electron Multiplier) -Micromegas (Micromesh gas detector) -APDs (Avalanche Photo Diodes)-LGADs (Low Gain Avalanche Diodes)- SiPMs(Silicon Photo Multipliers) -Strip detectors-Pixel detectors- Wire Chambers -Liquid Argon TPCs.</li> </ul>

<b>Module 2</b>	<b>Signals Treatment</b>
<b>Lecturer</b>	Alberto Aloisio (unina)
<b>Planned hours</b>	10
<b>Planned schedule</b>	
<b>Prerequisites</b>	
<b>Description</b>	<p>Sistemi di schermatura e di guardia nella lettura di sensori e rivelatori</p> <ul style="list-style-type: none"> <li>- Cenni sul noise di componenti attivi e passivi</li> <li>- Uso del simulatore analogico per l'analisi di alcuni casi di studio: rumore di alcune configurazioni base degli amplificatori operazionali, effetto della capacità del rivelatore sul noise gain</li> </ul>

### *III. Multi-Messenger and Particle Astrophysics of Compact Objects*

<b>Module 1</b>	<b>Compact Objects</b>
<b>Lecturer</b>	Francesco De Paolis (Università del Salento)
<b>Planned hours</b>	6
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic Astrophysics
<b>Description</b>	<ul style="list-style-type: none"> <li>• Last stages of stellar evolution and formation of the compact objects</li> <li>• Phenomenological properties of neutron stars and pulsars</li> </ul> Selected recent topics on the physics of the compact objects
<b>Recommended texts</b>	<ul style="list-style-type: none"> <li>• Slides of the lecturer and texts suggested during the lectures</li> </ul>
<b>Assessment methods</b>	Short essay on one of the topics developed during the lectures

<b>Module 2</b>	<b>Neutrino Oscillations</b>
<b>Lecturer</b>	Daniele Montanino (Università del Salento)
<b>Planned hours</b>	6-8
<b>Planned schedule</b>	
<b>Prerequisites</b>	Particle physics
<b>Description</b>	<ul style="list-style-type: none"> <li>• Introduction to the neutrino masses, mixing and oscillations in vacuum and matter</li> <li>• Phenomenology of neutrino oscillations from terrestrial experiments and astrophysical sources, in particular solar neutrinos</li> </ul>
<b>Recommended texts</b>	<ul style="list-style-type: none"> <li>• Giunti, Kim, "Fundamentals of neutrino Physics and Astrophysics" (Oxford University Press, 2007)</li> <li>• Slides of the lecturer</li> </ul>
<b>Assessment methods</b>	Short essay on one of the topics developed during the lectures

<b>Module 3</b>	<b>Supernova Neutrinos</b>
<b>Lecturer</b>	Alessandro Mirizzi (Università di Bari)
<b>Planned hours</b>	6
<b>Planned schedule</b>	
<b>Prerequisites</b>	Particle physics
<b>Description</b>	<ul style="list-style-type: none"> <li>• Supernova (SN) explosion mechanism</li> <li>• SN 1987A neutrino observation</li> <li>• Future SN neutrino observations</li> <li>• Neutrino oscillations in dense SN medium</li> </ul>
<b>Recommended texts</b>	<ul style="list-style-type: none"> <li>• G. Raffelt, “Stars as Laboratories for Fundamental Physics” (University of Chicago Press, 1996)</li> <li>• Slides of the lectures</li> </ul>
<b>Assessment methods</b>	Short essay on one of the topics developed during the lectures

<b>Module 4</b>	<b>Gravitation, Relativity and Black Holes</b>
<b>Lecturer</b>	Mariafelicia De Laurentis (Università di Napoli)
<b>Planned hours</b>	6-8
<b>Planned schedule</b>	
<b>Prerequisites</b>	analytical mechanics, general relativity
<b>Description</b>	Rotating black holes: Kerr Spacetime and its global properties. Kerr black hole in Boyer-Lindquist coordinates. Zero-mass limit. Kerr-Schild form of the Kerr solution. Ergosphere and Horizon (Infinite redshift surface, Surface gravity, Surface geometry of horizon and ergo surface) Particle and Light Motion in Equatorial Plane. Matter accretion and black hole parameters change. Evolution in the black hole parameter space. Geodesics in Kerr Spacetime: General Case. Light Propagation. Black hole shadow. Generic properties of the rotating black hole shadows (Asymmetry, Flattening etc..). Image of Black Holes with the Event Horizon Telescope.
<b>Recommended texts</b>	Slides of the lectures
<b>Assessment methods</b>	Short essay on one of the topics developed during the lectures

<b>Module 5</b>	<b>Physics and Evolution of Supermassive Black Holes</b>
<b>Lecturer</b>	Maurizio Paolillo (Università di Napoli)
<b>Planned hours</b>	6-8
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic classical physics and gravitation. Useful but not required: Module “Gravitation, Relativity and Black Holes”, Introductory astrophysics, Physics of Galaxies
<b>Description</b>	The Discovery of Active Galactic Nuclei; Taxonomy of AGNs; clues to the interpretation: variability, luminosity and efficiency; steps toward unification: Eddington luminosity, Eddington mass and accretion rate; accretion efficiency. The Unified Model; AGN physical scales; broadband emission in AGNs; accretion disk spectrum; X-ray corona and other components. Observational evidence of the Unified Model: Quasar host galaxies; dynamical and reverberation mapping mass measurements; evidence of hidden BLR in Sy2; relativistic distortion in Fe lines; the Milky Way nuclear BH. AGN evolution from multi-wavelength studies of AGN populations optical, X-ray and infrared; luminosity function and number counts; AGN activity and number density evolution; resolving the Cosmic X-ray Background; Soltan argument: how to derive the current Black Hole mass density of the Universe; The link between Supermassive Black Holes and galaxy evolution; Evidences of AGN feedback in galaxies.
<b>Recommended texts</b>	Lecture slides; “Exploring the X-ray Universe”, Seward & Charles, 2010)
<b>Assessment methods</b>	Short essay on one of the topics developed during the lectures

<b>Module 6</b>	<b>Gravitational waves and Gamma-Ray Bursts</b>
<b>Lecturer</b>	Tristano Di Girolamo (Università di Napoli)
<b>Planned hours</b>	6-8
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic astrophysics and particle physics
<b>Description</b>	Generation of Gravitational Waves (GWs). Binary Black Holes (BBHs) as sources of GWs. Detection of GWs. Observations of GWs from BBHs. Gamma Ray Bursts (GRBs): observations and theoretical models. GRB progenitors. Black holes as central engines and final products of GRBs.
<b>Recommended texts</b>	Shapiro & Teukolsky, “Black Holes, White Dwarfs and Neutron Stars”
<b>Assessment methods</b>	Short essay on one of the topics developed during the lectures

<b>Module 7</b>	<b>Astrophysics with ultra-high-energy neutrinos and Neutrino Telescopes</b>
<b>Lecturer</b>	P. Migliozzi (INFN-Napoli)
<b>Planned hour</b>	8
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic astrophysics and particle physics
<b>Description</b>	Meson production, atmospheric neutrinos, the discovery of high-energy neutrinos, Sources of astrophysical neutrinos, Cosmic neutrino flux estimates, Neutrino detection principle and event topologies, The need for km <sup>3</sup> neutrino telescopes, Water and ice properties, Operating neutrino telescopes, Results from neutrino telescopes
<b>Recommended texts</b>	M. Spurio, "Particle and Astrophysics" T. Stanev, "High-Energy Cosmic Rays"
<b>Assessment methods</b>	Short essay on one of the topics developed during the lectures

## *IV. Fundamental Interactions: QCD and BSM*

<b>Module 1</b>	<b>Perturbative QCD</b>
<b>Lecturer</b>	Francesco Tramontano (NAPOLI)
<b>Planned hours</b>	12
<b>Planned schedule</b>	2 lectures per week two hours each
<b>Prerequisites</b>	Particle physics background
<b>Description</b>	The lectures introduce to some basic aspects and concepts of perturbative QCD: running coupling and asymptotic freedom, the parton model, infrared divergences and the factorization theorem, parton densities and parton evolution, colour coherence. Applications to e+e-annihilation, deep inelastic lepton-nucleon scattering and hadron-hadron collisions are discussed.

<b>Module 2</b>	<b>Teoria di Regge</b>
<b>Lecturer</b>	Giovanni Chirilli (Regensburg) ref. Claudio Corianò
<b>Planned hours</b>	10
<b>Planned schedule</b>	
<b>Prerequisites</b>	Particle physics background
<b>Description</b>	Regge Theory; High parton density; small x evolution equations and Wilson lines formalism; Background field method; High-energy Operator Product Expansion; High-energy factorization for scattering amplitudes;

<b>Module 3</b>	<b>Weak decays and effective Hamiltonians in the Standard Model and beyond</b>
<b>Lecturer</b>	Fulvia De Fazio (BARI)
<b>Planned hours</b>	16
<b>Planned schedule</b>	
<b>Prerequisites</b>	Particle physics background
<b>Description</b>	I describe in detail the effective Hamiltonians for weak decays of mesons constructed using the operator product expansion and the renormalization group methods. Applications to rare decays in the Standard Model and beyond will be considered.

## *V. Artificial Intelligence and Machine learning*

<b>Module 1</b>	<b>Data Modelling</b>
<b>Lecturer</b>	Nicola Amoroso (UniBA)
<b>Planned hours</b>	10
<b>Planned schedule</b>	
<b>Prerequisites</b>	
<b>Description</b>	Introduction: graph theory. Different graph models. Nodal and edge characterization. Local and global properties. Community detection. Learning: Basic definitions, bias, variance and cross-validation. Supervised Models. Deep Learning. Unsupervised models: Clustering.

<b>Module 2</b>	<b>Machine Learning: Basis and Applications</b>
<b>Lecturer</b>	Giorgio De Nunzio & Giuseppe Palma
<b>Planned hours</b>	10
<b>Planned schedule</b>	
<b>Prerequisites</b>	
<b>Description</b>	ML taxonomy: supervised, reinforcement, unsupervised; Regression: linear regression, GLM. Classification: scores (confusion matrix and related measures; ROC curve; calibration; cross entropy, Brier score), class imbalance. Bias-Variance tradeoff: underfitting, overfitting. Perceptrons and Shallow Feed-Forward Neural Networks. Applications of regression and classification: case studies in Physics and Medicine with synthetic and public access data (python).

<b>Module 3</b>	<b>Artificial Intelligence for Social Good</b>
<b>Lecturer</b>	Loredana Bellantuono (UniBA)
<b>Planned hours</b>	16
<b>Planned schedule</b>	8 Class lectures during Spring
<b>Prerequisites</b>	
<b>Description</b>	<p>Artificial Intelligence for Social Good (AI4SG) is a new research field, that tackles important social, environmental, and public health challenges by using methods of complex system analysis, such as network models and machine learning. Using a top-down approach, AI4SG aims at delivering positive social impact in accordance with the priorities outlined in the United Nations' 17 Sustainable Development Goals (SDGs).</p> <p>The course has an application-oriented approach and is organized in tutorials focused on the analysis of relevant case studies related to the achievement of SDGs.</p> <p><b>Programme:</b></p> <ul style="list-style-type: none"> <li>• Artificial Intelligence for Social Good (AI4SG): why and how. A primer on the main approaches to AI4SDG. The Python toolbox for big data analysis and visualization.</li> <li>• Complex systems and network science. Structure and properties of network graphs representing complex systems.</li> <li>• Case study 1 – Towards a more equitable education system (SDGs 4, 10). A complex network model to measure structural inequalities and territorial bias in the access to quality education.</li> <li>• Case study 2 – Social psychiatry (SDG 3). Investigating the impact of societal and environmental factors on the incidence of psychiatric disorders.</li> <li>• Machine Learning: predicting continuous variables with regression analysis.</li> <li>• Case study 3 – AI for the most vulnerable: interplay between hunger and climate change (SDGs 1, 2, 3, 13). Predicting food insecurity across sub-Saharan Africa with multivariate regression on data concerning prices, assets, and climate.</li> <li>• Natural Language Processing: preprocessing of text data, topic detection and sentiment analysis.</li> <li>• Case study 4 – The language of sustainability on social media (all SDGs). Topic modelling and sentiment analysis to unveil information from sustainability speech on Twitter.</li> </ul> <p><b>Recommended texts:</b></p> <p>Sebastian Raschka, Vahid Mirjalili, “Python Machine Learning” – Packt Publishing Ltd (2017).  Dmitry Zinoviev, “Complex Network Analysis in Python” – The Pragmatic Programmers, LLC (2018).</p> <p><b>Recommended texts:</b></p> <p>Seminar on a selected topic or presentation of a project concerning Artificial Intelligence for Social Good (AI4SG).</p>

## *VI. Quantum Information and Quantum Technologies*

<b>Module 1</b>	<b>Physical Coherence and Correlation Functions</b>
<b>Lecturer</b>	Saverio Pascazio (UniBA)
<b>Planned hours</b>	16
<b>Planned schedule</b>	Eight two-hour lectures
<b>Prerequisites</b>	Background in quantum theory, technologies and applications
<b>Description</b>	Optical Fluctuations and Coherence. Classical and Quantum theory. The Radiation field. Experimental milestones. Measuring correlation functions. Equilibrium equal-time (spatial) correlation functions Equilibrium equal-position (temporal) correlation functions. Beyond equilibrium. Phase transitions and correlation functions.

<b>Module 2</b>	<b>Introduction to Quantum Computation</b>
<b>Lecturer</b>	Luigi Martina (UniSalento)
<b>Planned hours</b>	16
<b>Planned schedule</b>	Eight two-hour lectures
<b>Prerequisites</b>	Quantum Mechanics and Statistical Mechanics
<b>Description</b>	Since at least a couple of decades, the Physics of Information and Computation has been a recognized as an autonomous discipline. In fact, the latter fields should be linked to the study of the underlying physical processes, namely of the quantum mechanical universe. But the intrinsic probabilistic character of the quantum measurements and the non-commutative algebra of the observables induce important modifications in the central results of classical information theory, including: quantum parallelism, compression of quantum information, bounds on classical information encoded in quantum systems, bounds on quantum information sent over a noisy quantum channel, efficient quantum algorithms and quantum complexity. The course will touch the above topics.

<b>Module 3</b>	<b>Quantum imaging</b>
<b>Lecturer</b>	Milena D'Angelo (UniBA) Cosmo Lupo (PoliBa)
<b>Planned hours</b>	16
<b>Planned schedule</b>	Eight two-hour lectures
<b>Prerequisites</b>	Background in quantum theory and optics. Attendance of either one of the two above modules is suggested.
<b>Description</b>	From classical to quantum imaging. Klyshko advanced wave model. Ghost imaging and diffraction, from first protocols to recent advances (differential GI, computational GI, compressive GI,..). Single-pixel imaging. Super-resolution: NOON states, and Quantum Fisher information. Sub-shot-noise imaging. Imaging by undetected photons. Imaging through turbulence and scattering media, and imaging around corners. Correlation plenoptic imaging: from principles to applications.

## *VII. Experimental High-Energy Astroparticle Physics*

<b>Module 1</b>	<b>Experimental Techniques in Astroparticle Physics</b>
<b>Lecturer</b>	Giovanni Marsella (Palermo)
<b>Planned hours</b>	16
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic particle physics, astrophysics and detectors
<b>Description</b>	<p>Description of the principal experimental techniques in Astroparticle Physics</p> <p>Contents:</p> <ul style="list-style-type: none"> <li>• Introduction to Cosmic Ray (CR) sources</li> <li>• Primary CRs, acceleration mechanism, propagation</li> <li>• Secondary CRs, atmospheric showers</li> <li>• Detection techniques in Space, Extensive Air Shower arrays and underground detectors</li> <li>• Presentation of the principal experiments and recent results</li> </ul>
<b>Recommended texts</b>	
<b>Assessment methods</b>	

<b>Module 2</b>	<b>HE and VHE Observations from Extragalactic Sources</b>
<b>Lecturer</b>	Lorenzo Perrone et al. (Lecce)
<b>Planned hours</b>	5-10
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic particle physics, astrophysics and detectors
<b>Description</b>	The lectures intend to cover the description of the detection techniques of ultra-high energy cosmic rays (Pierre Auger Observatory, Telescope Array) and the current status of the art (result and perspectives) in the field.
<b>Recommended texts</b>	Review papers and journal papers.
<b>Assessment methods</b>	Lessons, final report, hands-on session

<b>Module 3</b>	<b>HE Transients and the Multimessenger Context</b>
<b>Lecturer</b>	Elisabetta Bissaldi (Politecnico di Bari)
<b>Planned hours</b>	16
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic astrophysics, Detectors
<b>Description</b>	<ul style="list-style-type: none"> <li>- Transient phenomena in the gamma-ray sky: Gamma-Ray Bursts (GRBs), Soft Gamma Repeaters, Terrestrial Gamma-Ray Flashes; Solar Flares. Temporal and spectral characteristics;</li> <li>- Multi-frequency and Multi-messenger studies; LIGO/Virgo gravitational wave (GW) events and follow-up observations; The case of GRB 170817A / GW 170817; IceCube neutrino events and follow-up observations; The case of TXS 0506+056; Other recent discoveries in the field.</li> </ul>
<b>Recommended texts</b>	<ol style="list-style-type: none"> <li>1. Longair - "High-energy astrophysics"</li> <li>2. De Angelis &amp; Pimenta - "Introduction to Particle and Astroparticle Physics"</li> <li>3. Recent Publications</li> </ol>
<b>Assessment methods</b>	Lessons, final report

<b>Module 4</b>	<b>Indirect Dark Matter Searches</b>
<b>Lecturer</b>	Francesco Loparco (Bari)
<b>Planned hours</b>	16
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic particle physics and detectors
<b>Description</b>	<ol style="list-style-type: none"> <li>1) Dark Matter models</li> <li>2) Dark matter distribution in galaxies</li> <li>3) WIMPs as dark matter candidates</li> <li>4) Indirect dark matter searches with gamma rays and charged particles</li> <li>5) Searches dark matter from the Sun</li> </ol>
<b>Recommended texts</b>	Recent publications, some textbooks, slides from the lecturer
<b>Assessment methods</b>	Final report

<b>Module 5</b>	<b>Experimental Techniques in Space Science</b>
<b>Lecturer</b>	Beatrice Panico (Unina)
<b>Planned hours</b>	10
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic of cosmic ray physics, Detectors
<b>Description</b>	<p>The course will present the experimental techniques applied in the observation of cosmic rays from space. An overview on the next generation of space-based instrument for cosmic rays measurements will be provided. The course is designed for students performing doctoral studies in experimental astroparticle physics.</p> <p>Summary: 1) Open scenarios on the basic physical processes involving low energy cosmic rays, coming from astrophysical accelerators in high-density regions and from Dark Matter. 2) Methods and observing techniques to study cosmic rays from space 3) Current research in multimessenger astroparticle physics and in Space Weather. 4) UHECRs from space 5) Extracting a spectral energy distribution from data provided by different experiment</p> <p>During the course some practical experiences with students are foreseen: from data handling to software design and development, statistical analysis. In specific cases students are allowed and invited to investigate in-depth topics and to discuss during lectures.</p>
<b>Recommended texts</b>	To be defined
<b>Assessment methods</b>	Students will be evaluated based on a final short seminar on an article or a modern research topic selected according to their interest.

<b>Module 6</b>	<b>Dark Matter in cosmology and astrophysics</b>
<b>Lecturer</b>	Fabio Iocco (Unina)
<b>Planned hours</b>	14 in 7 lectures
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic of particle and particle physics
<b>Description</b>	<p>1-2) Evidence of a non-electromagnetically interacting component in astrophysical systems. (*Dark *matter in the CMB, Galaxy clusters, local disk galaxies).</p> <p>3) Properties of the non EM-interacting component (Dark matter, DM) from other astrophysical probes (Lyman-alpha forest, etc.)</p> <p>4) Candidates of Dark Matter: non-exotic forms of matter and the search for it.</p> <p>5) Candidates of Dark Matter: beyond the standard model of particle physics.</p> <p>6) Search for specific candidates: the WIMP. Direct and indirect searches.</p> <p>7) Alternatives to DM, the problems of LCDM paradigm.</p>
<b>Recommended texts</b>	to be defined
<b>Assessment methods</b>	To be defined

## *VIII. Statistical Physics for Complex Systems*

<b>Module 1</b>	<b>Active Matter and Complex Fluids</b>
<b>Lecturer</b>	Giuseppe Gonnella (UniBA) – Antonio Lamura (CNR-Bari)
<b>Planned hours</b>	16
<b>Planned schedule</b>	Eight two-hour lectures
<b>Prerequisites</b>	Background in classical physics and statistical mechanics
<b>Goal</b>	The purpose of these lectures is to give an introductory overview to recent research developments in the field of applications of statistical and theoretical physics to complex fluids, soft matter and biological systems.
<b>Description</b>	Statistical physics and biological systems. Active matter: basic particle and continuous models. The phase diagram of passive and active colloids. Topological transitions. Complex fluids: theoretical modeling. Polymers: static and dynamical properties in dilute conditions. Ternary mixtures with surfactant: self-aggregation, active and double emulsions. Basic rheological behavior of complex fluids. The yielding transition. Simulations methods in soft and active matter. Molecular dynamics, Multi-Particle Collision Methods, Lattice Boltzmann Methods.

<b>Module 2</b>	<b>Statistical Mechanics of Complex Systems</b>
<b>Lecturer</b>	Antonio De Candia (UniNa Federico II)
<b>Planned hours</b>	16
<b>Planned schedule</b>	Eight two-hour lectures
<b>Prerequisites</b>	Basic knowledge of statistical mechanics.
<b>Goal</b>	The purpose of these lectures is to introduce basic concepts in the physics of complexity, as they emerge in the context of disordered systems.
<b>Description</b>	The Sherrington - Kirkpatrick model for spin glasses. Replica - symmetric solution. The Parisi solution. The p - spin model. The cavity method. Dynamics and Mode - Coupling theory. TAP equations. The spin - glass on the Bethe lattice.

<b>Module 3</b>	<b>Stochastic Processes and Analysis of Correlations</b>
<b>Lecturer</b>	Eugenio Lippiello (University of Campania "Luigi Vanvitelli")
<b>Planned hours</b>	16
<b>Planned schedule</b>	Eight two-hour lectures
<b>Prerequisites</b>	Background in classical statistical mechanics.
<b>Goal</b>	The purpose of these lectures is to give a simple mathematical introduction to the description of stochastic processes with innovative applications in the field of epidemiology and earthquake data time- series analysis.
<b>Description</b>	Markov processes. Master and Fokker Plank equations. Stochastic energetics. Branching processes. Watson-Galton model. Application to genetics. Epidemic models. Applications to epidemiology and earthquake occurrence. Analysis of correlations in stochastic signals. Detrended Fluctuation Analysis. Power spectrum of a signal.

## *IX. Biophysics for Health and Environment*

<b>Module 1</b>	<b>Biophysical mechanisms and therapeutic implications of human exposure to ionising radiation</b>
<b>Lecturer</b>	Lorenzo Manti (Università Federico II Napoli)
<b>Planned hours</b>	20
<b>Planned schedule</b>	10 lectures of 2 hours each
<b>Prerequisites</b>	Fundamentals of radiation-matter interaction
<b>Description</b>	The aim of the course is to provide an overview of the unique biological action exerted by ionizing radiation (IR). The ensuing effects at cellular and tissue level are governed by the spatio-temporal mode with which energy deposition occurs at the nanometer level (i.e., at the scale of the DNA) and are influenced by a cascade of complex biomolecular responses. The course will therefore illustrate the main biophysical principles on which modern radiotherapy (RT) relies. New approaches will be also discussed such as the use of accelerated particle beams (hadrontherapy) and the exploitation of nuclear fusion reactions where physics can give an essential contribution to IR-based cancer therapy

<b>Module 2</b>	<b>Biophotonics for clinics and environment</b>
<b>Lecturer</b>	Maria Lepore (Università della Campania «Luigi Vanvitelli») - Ines Delfino (Università della Tuscia)
<b>Planned hours</b>	20
<b>Planned schedule</b>	
<b>Prerequisites</b>	Basic concepts of optical techniques
<b>Description</b>	The course will deal with the application of optical techniques to the development of new diagnostic strategies and environment monitoring tools. Vibrational and fluorescence spectroscopies will be used for investigating biofluids, human tissues, radioexposed cells and enzymes in order to monitor biological processes and to develop sensor devices.

## *X. Nuclear Theory and Fundamental Interactions*

<b>Module 1</b>	<b>Chiral Effective Field Theory in Nuclear and Particle Physics</b>
<b>Lecturer</b>	Luca Girlanda (Università del Salento)
<b>Planned hours</b>	10-12
<b>Planned schedule</b>	2 hours/week
<b>Prerequisites</b>	Quantum Field Theory
<b>Description</b>	<p>The lectures will cover aspects of non-perturbative QCD, with special reference to the approximate chiral symmetry and its realizations.</p> <p>After a brief recollection of the old current algebra techniques and soft pion theorems, the modern approach based on effective Lagrangians will be discussed.</p> <p>The foundation and scope of Chiral perturbation theory will be presented in the meson sector and extended to include a single baryon. Finally, the complications pertaining to the few-nucleon sector will be addressed in the context of Weinberg proposal to explain the hierarchy of nuclear interactions. The importance of a robust quantification of the nuclear uncertainty, based on the convergence pattern of chiral expansions, for the research in fundamental interactions will be emphasized.</p>

<b>Module 2</b>	<b>Theory of Nuclear Forces and Nuclear Matter</b>
<b>Lecturer</b>	Luigi Coraggio (UniCampania)
<b>Planned hours</b>	20
<b>Planned schedule</b>	
<b>Prerequisites</b>	
<b>Description</b>	<p>The goal of this course is to introduce PhD students to our present knowledge of the theory of nuclear forces and, as its application, of infinite nuclear matter. First, the basic phenomenological features of the nuclear potential are presented, and their connection to the main aspects of strong force. Then, we start to follow the path that from the Yukawa potential, through models based on the meson theory, historically leads to the present approach to the derivation of two- and three-body nuclear forces which are rooted in the QCD by way of the effective field theory. Last section is devoted to study the nuclear environment that is considered the best testing ground for models of nuclear forces, that is the infinite nuclear matter. To this end, basic knowledge of the derivation of the equation of state of nuclear matter in terms of the Brueckner theory will be provided to the students.</p> <p>This topic may be of interest also for those scholars that are interested in astrophysical systems such as the neutron stars, whose structure may be described in terms of the equation of state infinite nuclear matter.</p>
